

Sustainable Water Management Initiative Advisory Committee

Presentation Title:	Stream Categorization: Describing the Current Condition
Presented By:	Todd Richards Division of Fish and Wildlife
Date of Presentation:	September 1, 2010

The following presentation is offered for discussion purposes only and does not necessarily represent current statute, regulation, or policy positions of the Commonwealth of Massachusetts unless specifically acknowledged.

This presentation is not to be cited as a reference. It's purpose is to foster open and broad discussion of the issues as well as help assure public awareness of the discussions as of the date of the presentation.

Stream Categorization: Describing the Current Condition

Categorization

- Statewide Screening Tool
- Describe the Current Condition
- Using Best Available Science
- Living Document
- Useful Tool for Discussion of:
 - Goal Setting
 - Streamflow Criteria
 - Safe Yield

Fish Communities

- The Fish Tell the Story
 - Long-lived
 - Reflect stresses over time
 - Easily recognized and identified
 - Well-studied
 - Good indicators of the condition of the aquatic environment

Rivers Should Have River Fish Communities

What is a River Fish?

Brook Trout

Fallfish

Creek Chubsucker

Tessellated Darter

Common Shiner

FOR DISCUSSION PURPOSES ONLY - NOT TO BE CITED

Preliminary Assessment of Factors Influencing Riverine Fish Communities in Massachusetts

by

**David Armstrong
Sara Brandt**

Foundation: USGS Study

Fluvial Fish Relative Abundance Model

■ Benefits

- Highly significant variables
- Best Model that Included
 - Natural Basin Characteristics
 - Flow Alteration
 - Impervious Cover

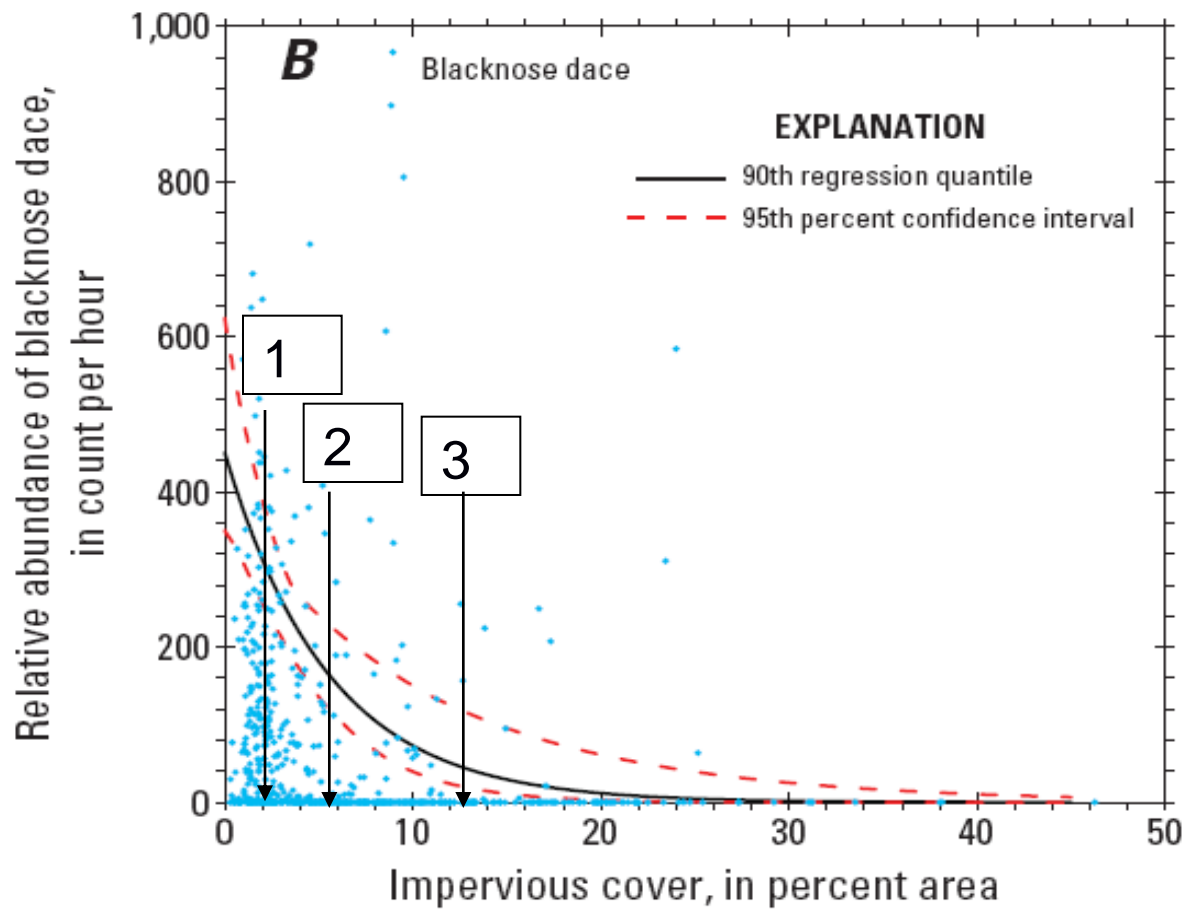

Categories

- Categories are Narrow at low end of alteration – High quality resources have sensitive populations that respond more extensively to alteration
 - TITAN Analysis
 - Quantile Regression
- Categories are Broad at high end of alteration – Communities of more tolerant individuals remain, providing less change per unit alteration
 - GLM equation
 - Biological Conditions Gradient

FOR DISCUSSION PURPOSES ONLY - NOT TO BE CITED

Fish Community Response

Baseline Condition

Fluvial Relative Abundance

Example Basin 11031

Total % Biological Alteration = 13% (Category 2)

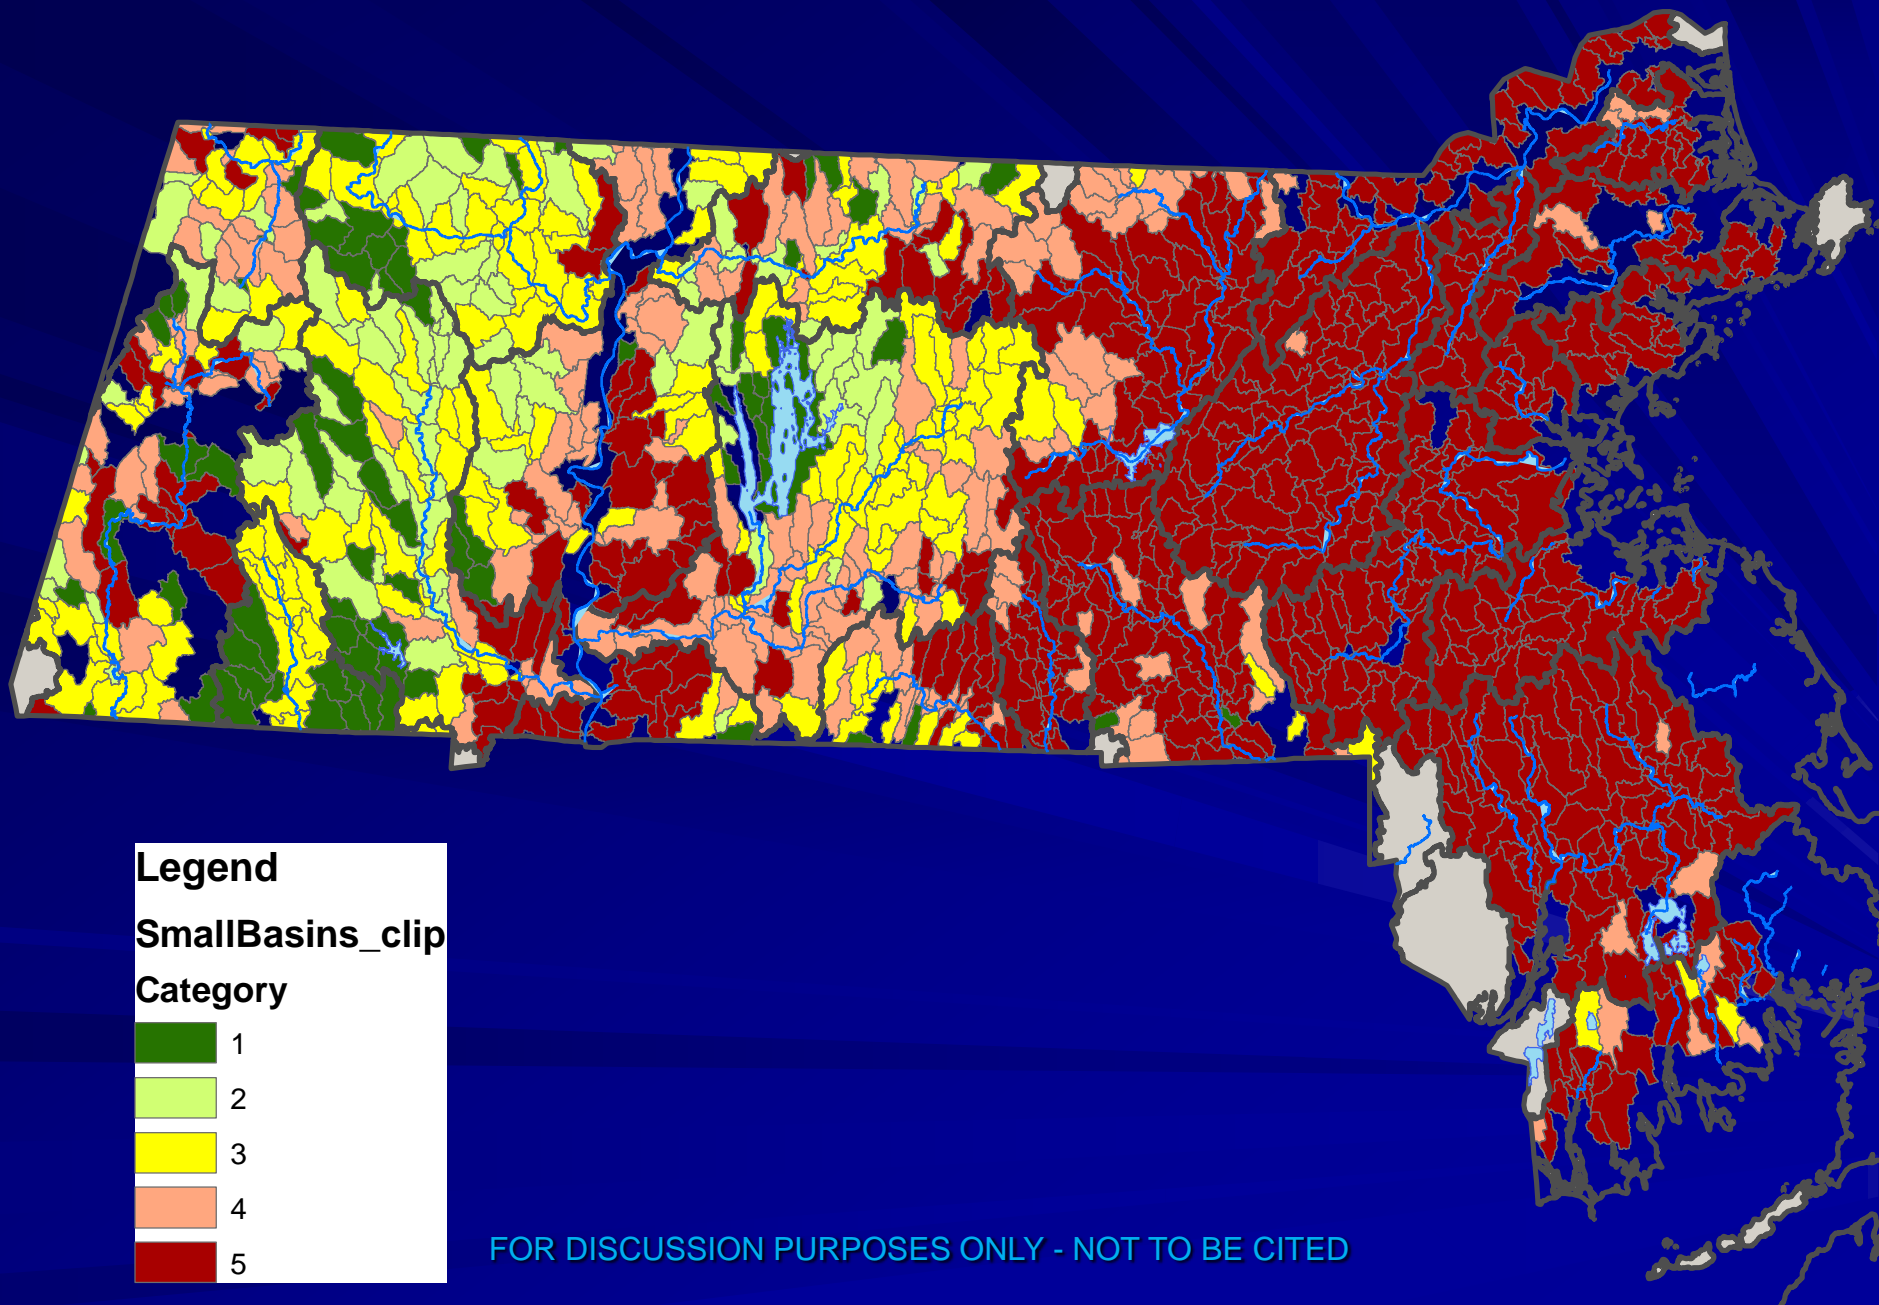

Alteration Due to IC = 12%

Alteration Due to August Alteration = 1%

FOR DISCUSSION PURPOSES ONLY - NOT TO BE CITED

Basin-Specific Calculation

- Enter individual basin variables
- MWI 1429 Sub-basins
- Run Regression Equation
